STATE

NOVEMBER 3, 2015

# California gov. declares emergency over dead trees

*The Associated Press*

**A dead-tree census by the U.S. Forest Service found that 22 million trees have died during California's four-year drought, and tens of millions more are expected to follow.**

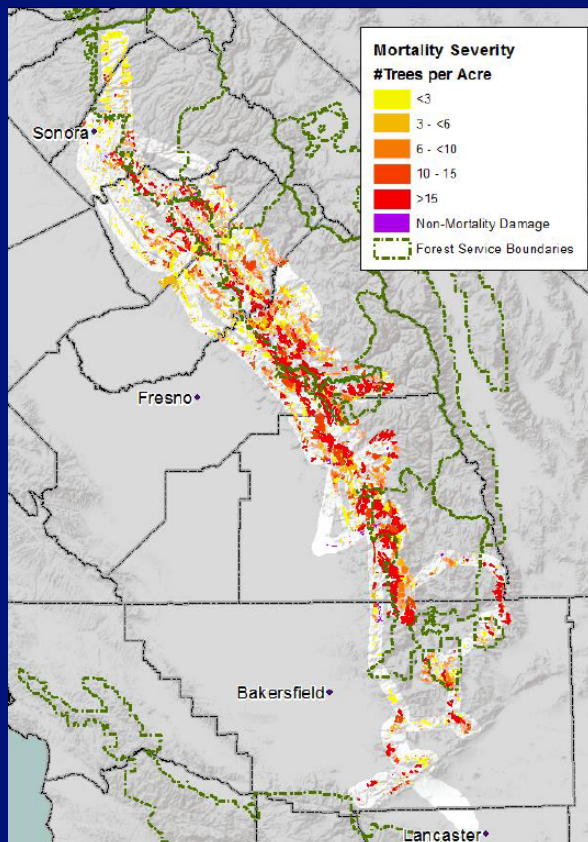

# Southern Sierra Nevada die-back event of 2015

USFS Region 5 Aerial Detection Survey – July 6<sup>th</sup> to 7<sup>th</sup> , 2015

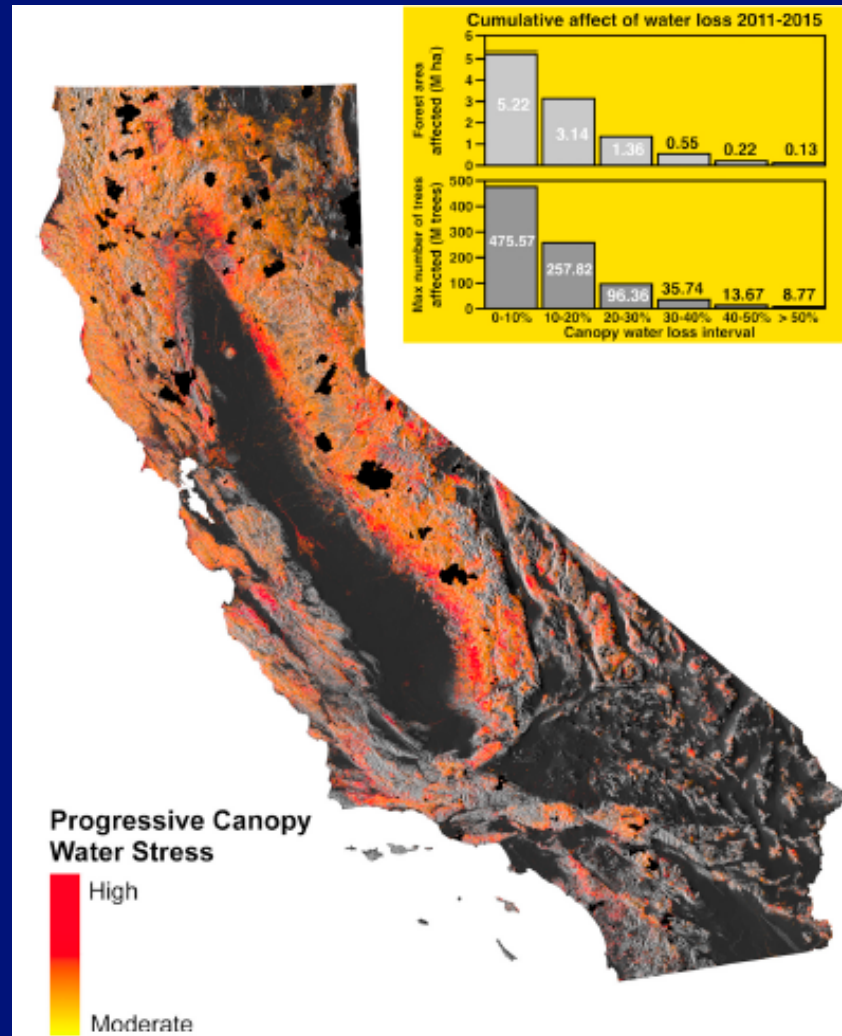

Area surveyed: 3.6 million acres

Areas with mortality: 0.5 million acres

Estimated number of trees killed: 6 million

# California state-wide die-back event?

Approximately 10.6 million ha of forest containing up to 888 million large trees experienced measurable loss in canopy water content...

Asner et al. 2016 *PNAS*

What, if anything, can be done?

## Adaptation strategies

**Resistance:** ability to remain essentially unchanged following disturbance

**Resilience:** ability to recover quickly from disturbance

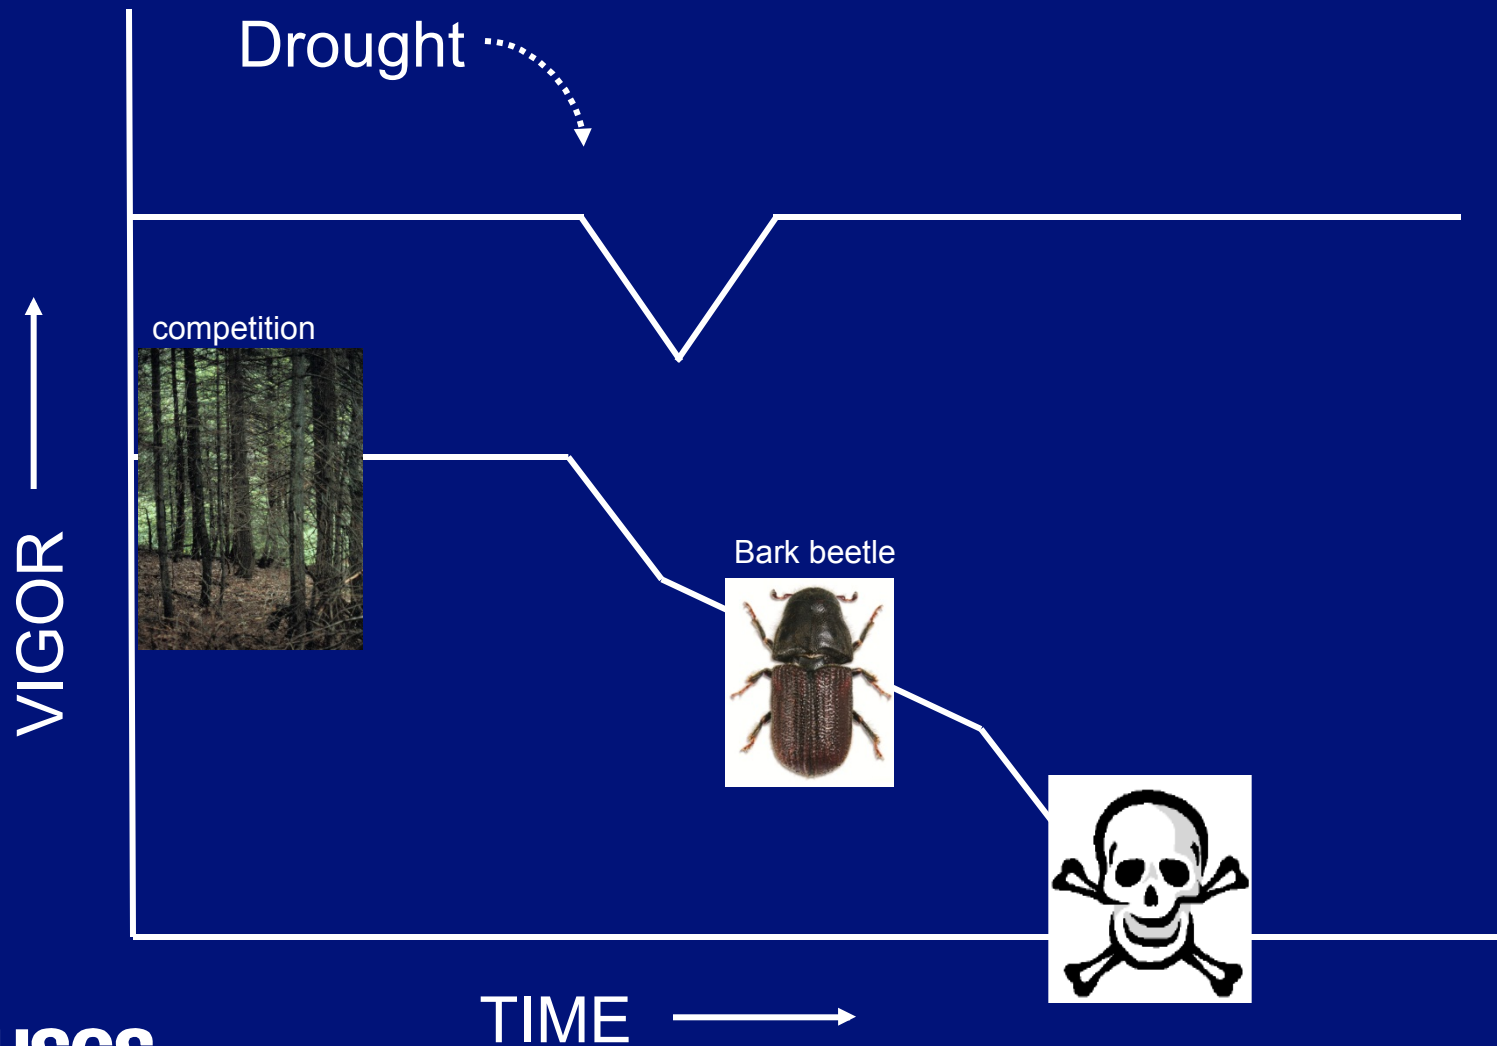

# The decline spiral model of tree death

Franklin, 1987 *Bioscience*

# The decline spiral model of tree death

Can prescribed fire increase forest resistance to drought?

## Mechanical thinning at Lassen Volcanic NP

Credit: C. Farris, NPS

# Second growth forest thinning at Redwood National Park

# Can prescribed fire increase forest resistance to drought?

## Late season prescribed fire effects at Sequoia NP

Pre-fire

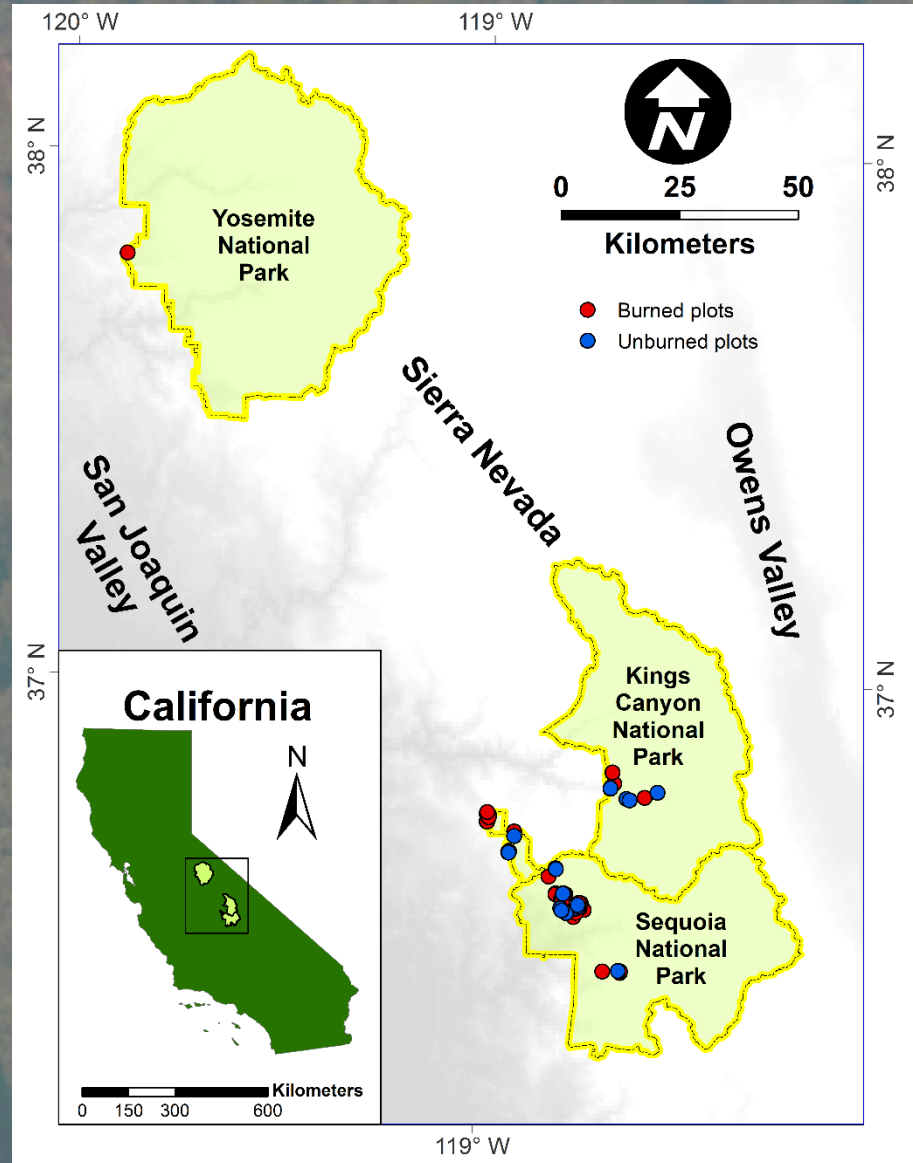

1 year post-fire

# Can prescribed fire increase forest resistance to drought?

- Long-term forest plot data
- Surveys in 2014
- Ponderosa pine – mixed conifer forests (mostly *A. concolor*)
- 38 burned plots, 18 unburned plots
- $\geq 6$  years post-fire
- $\sim 10,000$  trees

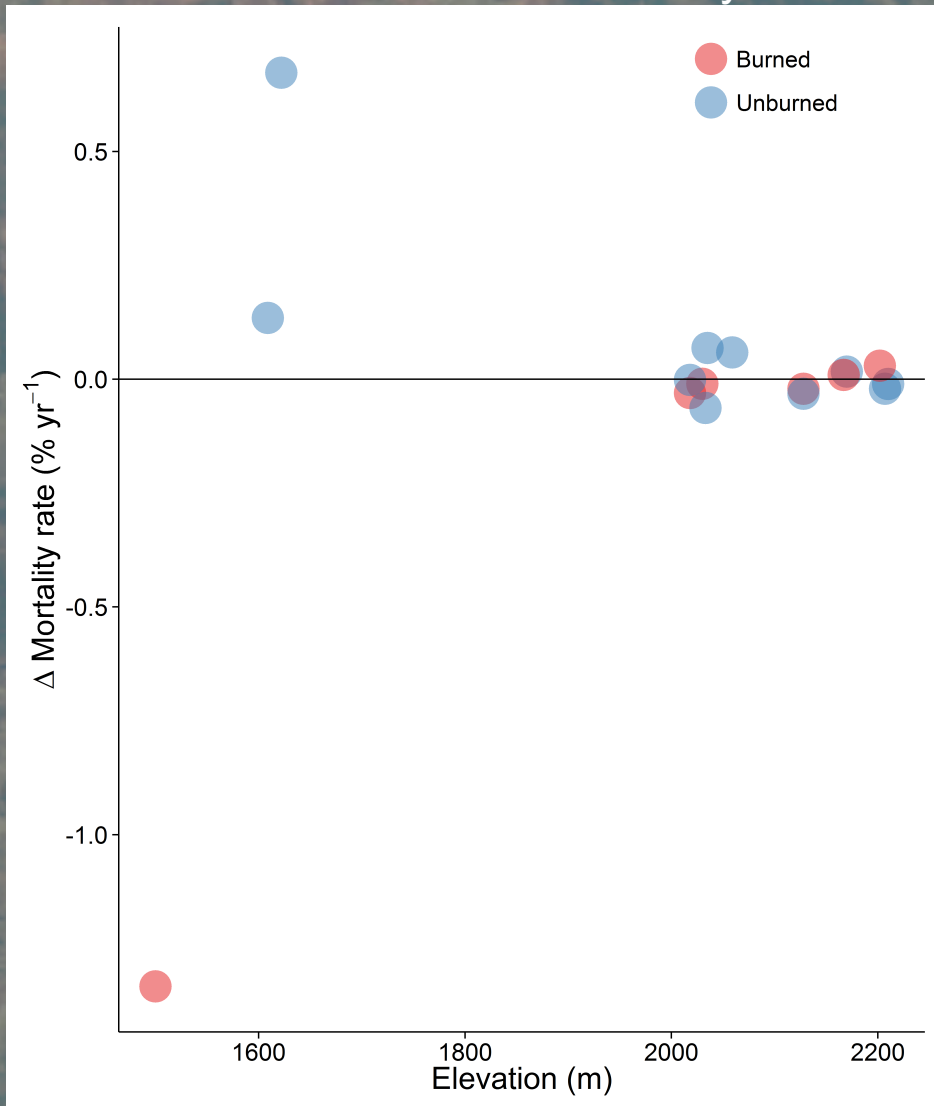

van Mantgem *et al.* in press *Fire Ecology*

Credit: N. Stephenson

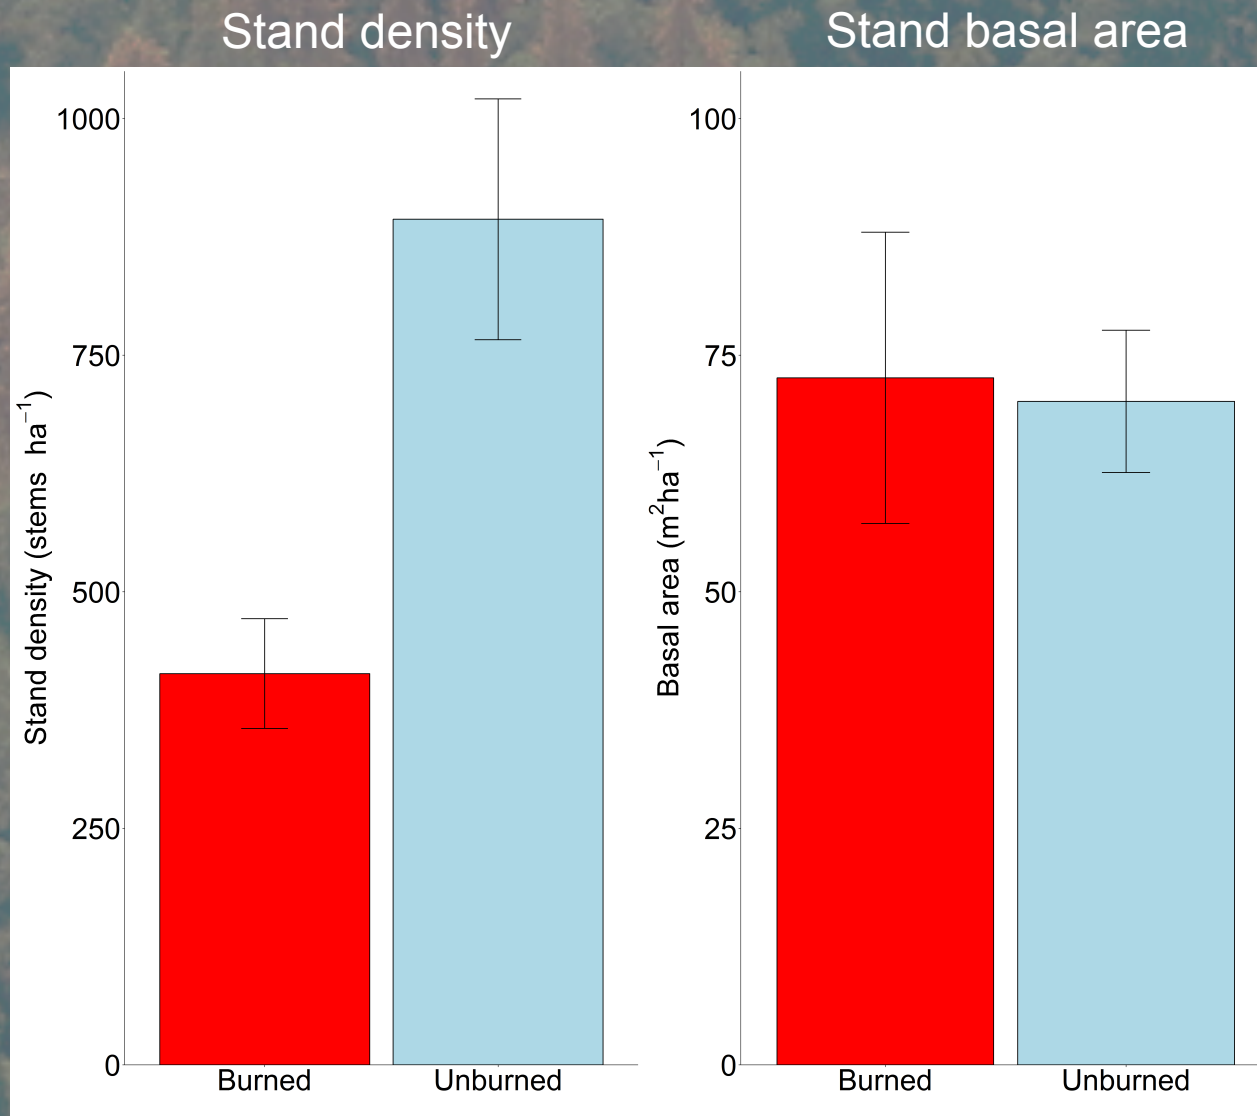

# Can prescribed fire increase forest resistance to drought?

2013-2014 mortality

# Can prescribed fire increase forest resistance to drought?

# Can prescribed fire increase forest resistance to drought?

## Findings

Probability of death lower in burned stands in 2013, 2014 (after accounting for tree size and taxonomic group).

What is the impact of continued drought in 2015?

Can we explicitly identify the mechanisms of tree mortality??  
i.e., roles of competition, pathogens, insects?

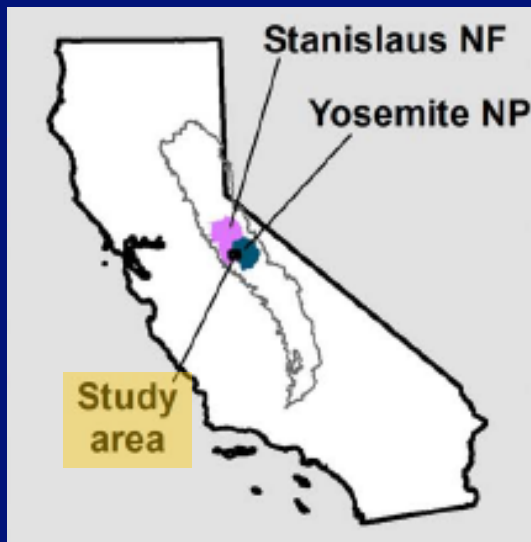

Other species, other regions???

# Can prescribed fire increase forest resistance to drought?

ponderosa pine stand structure, central Sierra Nevada  
Trees  $\geq 15.2$  cm DBH

1911 USFS inventories  
TPH: 72.7 trees  $\text{ha}^{-1}$   
Basal area: 21.5  $\text{m}^2 \text{ha}^{-1}$   
(Collins *et al.* 2015 *Ecol. Appl.*)

2013 Post-fire Yosemite, Kings Canyon  
and Sequoia NP  
TPH: 159 trees  $\text{ha}^{-1}$   
Basal area: 74.0  $\text{m}^2 \text{ha}^{-1}$   
(van Mantgem *et al.* in press *Fire Ecology*)

# Can prescribed fire increase forest resistance to drought?

Next steps...

[www.werc.usgs.gov/DroughtForestFire](http://www.werc.usgs.gov/DroughtForestFire)

- 1) Survey tree mortality in burned and unburned areas.
- 2) Construct mortality models in burned and unburned stands (using tree rings).

## FMH plot locations

# Can prescribed fire increase forest resistance to drought? Next steps...

## Potential study sites

### California

FMH plots

Fire & Fire Surrogate sites (Goosenest, Sequoia NP)

USGS Forest Dynamics plot network (YOSE, SEKI only)

Teakettle Experimental Forest

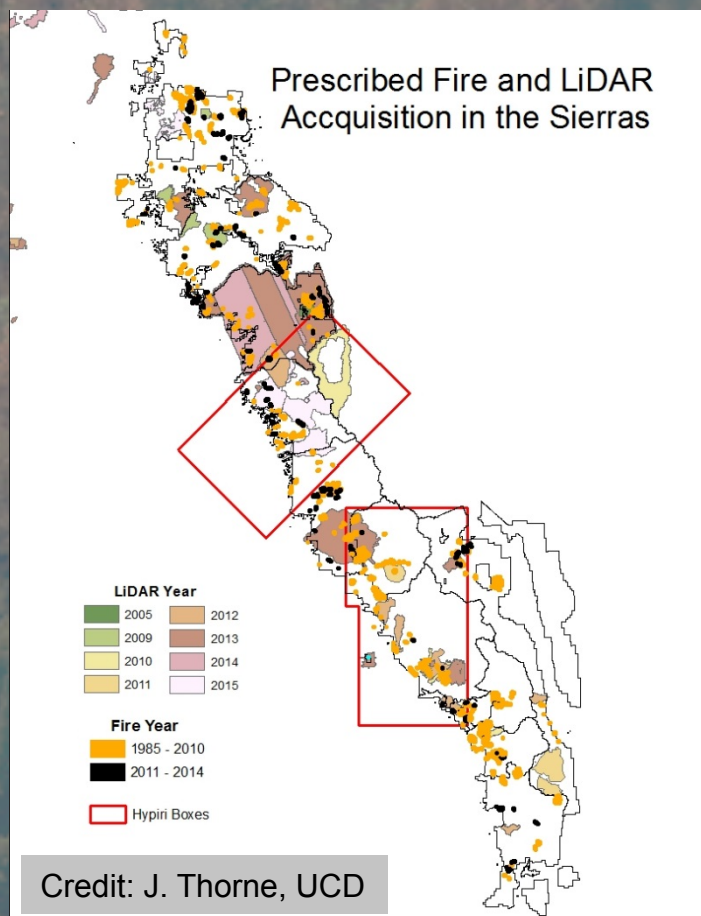

### Colorado Plateau

FMH plots

Fire & Fire Surrogate sites (Jemez Mountains, N. Arizona)

# Can prescribed fire increase forest resistance to drought? Next steps...

In the central and southern Sierra Nevada relate forest structure and management history (thinning, prescribed burning) to remotely sensed indices of drought response (e.g., aerial mapping of forest dieback, Landsat time series, hyperspectral data).

What, if anything, can be done?

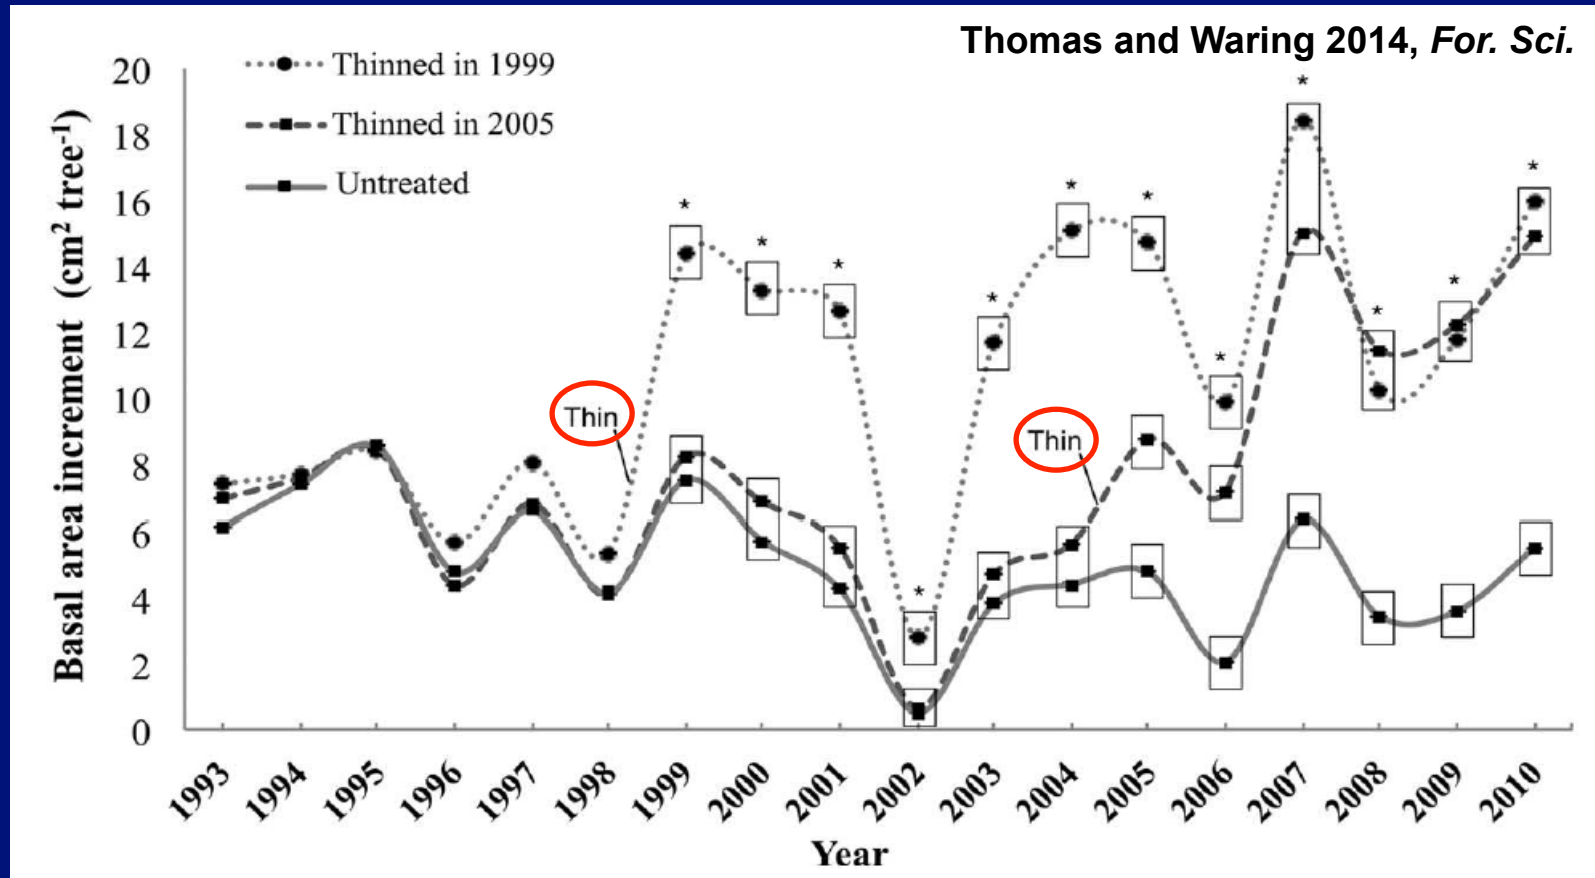

## Adaptation strategies

**Resistance:** ability to remain essentially unchanged following disturbance

**Resilience:** ability to recover quickly from disturbance

# Resilience?

- 30 *P. ponderosa* stands in northern NM
- History of high grading logging and grazing
- Thinned and Rx fire in 1999 (n=11) or in 2004 (n=7)  
Treatments lowered stand density and BA

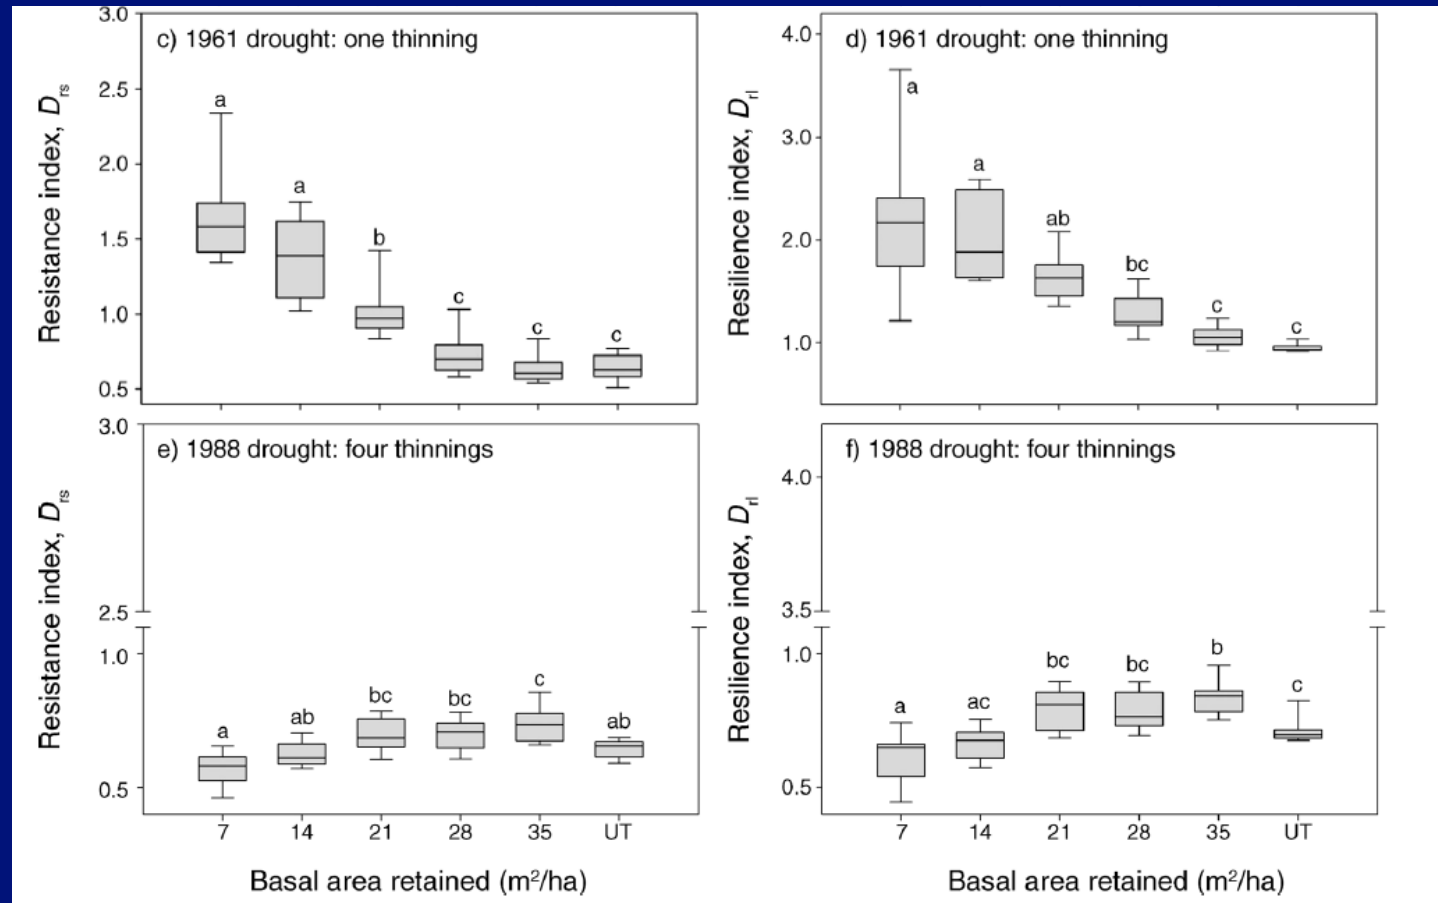

# Resilience?

D'Amato et al. 2013 *Ecol. Appl.*

- Long-term thinning experiment on *P. resinosa* (red pine) in MN
- Varied levels of BA retention (7 to 35 m<sup>2</sup> ha<sup>-1</sup>)

1961 Drought  
+ thinning effects

1988 Drought  
- thinning effects

## **Barriers to implementation**

Prescribed fire funding, air quality, burning windows, site accessibility

Prescribed fire may not be sufficiently severe (*Higgins IJWF 2015*)

Hotter droughts may produce stresses that exceed potential management responses

[www.werc.usgs.gov/DroughtForestFire](http://www.werc.usgs.gov/DroughtForestFire)

# The take home!

- The 2012-2015 drought may be a “sneak peak” of future conditions.
- Thinning treatments (mechanical, prescribed fire, or both) have the potential to increase forest resistance and resilience to drought.
- Thinning treatments may represent “no regrets” management options, though barriers exist to implementation.

# Thanks!

Countless field crews and data managers...

National Park Service, USGS,
