www.ucanr.edu/cluh *CENTER FOR LANDSCAPE & URBAN HORTICULTURE*

- B.S. & M.S. Horticulture, Ohio State University
- 38 years experience
 - Educational and applied research programs
 - Landscape & urban horticulture
 - Landscape irrigation mgt., plant water needs, weather-based irrigation control
 - Presentations, workshops, publications, Web

University of California

Agriculture and Natural Resources

Cooperative Extension

• Los Angeles County/UC Riverside

Objectives

Understand:

- Priorities for limited irrigation water
- Tree water demand and water requirements
- Fundamentals of effective tree water management

Value of Urban Trees

- Structural framework of landscapes
- Cooling shade
- Carbon dioxide storage
- Wildlife habitat
- Beauty
- Mental well-being

Prioritizing Irrigation

- Focus water on valuable & difficult to replace plants
- **Trees/Shrubs/Vines/Grndcvr > Perennials > Turf/Annuals**

Why & How Plants Use Water

- Transpiration
- SPAC: *Soil-Plant-Air-Continuum*
- Creates pull

Why & How Plants Use Water

- *Water loss is essential!!*
- Maintains plant structure
- Photosynthesis & physiological processes
- Cooling
- Transports minerals & nutrients

Evapotranspiration (ET)

Evapotranspiration = Evaporation + Transpiration

ET_o = Reference Evapotranspiration

Estimate of environmental demand for evaporation and transpiration from a reference planted area

- Climate-based reference
- Inches/day
- ET_o = estimated water use of well-watered cool-season turf
- Calculated from weather data
 - Sunlight, temperature, RH, wind
 - ASCE Penman-Monteith equation
- Based on field research with agricultural crops

Landscape Water Budget or Water Need

$$\text{Inches} = \text{ETo} \times \text{PF}$$

$$\text{Gallons} = \text{ETo} \times \text{PF} \times \text{Sq. Ft. LA} \times 0.62$$

- ETo = inches of reference ET, CIMIS, etc.; climate impact
- PF = plant factor to adjust ETo (turf, shrub, tree, flowers, etc.)
- LA = sq. ft. landscape area
- 0.62 = converts inches of water to gallons

Plant Factors

Percent of ET Required

UPCOMING EVENTS

Event Name	Date
WORKSHOP: Dealing with Drought & Landscape Watering Restrictions - 2015	9/2/2015
Landscape EXPO	

Average California Water Use
Statewide Developed Water
2005 Urban - 9% Landscape

Category	Percentage
Agriculture	65%
Indoor Residential	15%
Outdoor Residential	10%
Lawns/Landscapes	10%

Tree Root Systems

- Tree root systems are wide & shallow
- 80%-90% of roots are within top 2 feet
- Tap root reduced as tree matures

Tree Water Demand

Drought Resistance

Irrigate to
refill root
zone

- *How long until out of water (MPG)?*
- *What happens when water gets low (run out of gas)?*

Tree Water Demand

- Trees have considerable drought resistance/tolerance
- Species response to severe dryness varies

Low = wilting

**Medium =
margin burn**

**Medium =
defoliation**

**High = not
visible until
dead**

Water Management for Trees

- Wet soil (roots) 1-2 ft. deep
- Apply $\approx 0.5-2.0$ in.
- Summer Rule of Thumb:
 - every 5-15 days
 - *when:*
 $\Sigma(\text{daily } E_{To} \times 0.5) \approx 0.5-2.0$ in.

Water Management for Trees

- Consider root depth, soil, ETo
 - 2 ft. roots + low ETo → 15 days
 - 1 ft. roots + high ETo → 5 days
- Shorter interval with drip
- Extend interval $\leq 30\%$ short-term

UPCOMING EVENTS

Event Name	Date
WORKSHOP: Dealing with Drought & Landscape Watering Restrictions - 2015	9/2/2015
Landscape EXPO	

Average California Water Use
Statewide Developed Water
2015 Urban - 9% Landscape

Category	Percentage
Agriculture	58%
Indoor Residential	25%
Outdoor Residential	15%
Landscaping	9%

Trees in Healthy Turfgrass

- Turf dictates irrigation
- Tree water requirement met with turf's
- Trees require no added water
- Irrigation uniformity critical

Trees Closely Spaced & Trees in Mixed Plantings

- $\geq 80\%$ canopy cover – treat as 100% plant cover
- Planting functions as big leaf
- Water requirement set by plant type with highest PF
- Hydrozone plantings
- Irrign. uniformity not critical

Isolated or Widely-Spaced Trees

- <80% canopy cover
- Active transpiration is outer foliage
- Estimate canopy surface area of single plants
- Transpiration can be lower in paved areas
- Irrig. uniformity not critical

Transpiring Leaf Area

$$\text{Transpiring Leaf Area} \approx 3.14 \times \text{Crown Radius}^2$$

Trees in Under-Irrigated Turf

- Meet tree water requirements
- Estimate water requirement based on % canopy cover
- Apply water to at least dripline in isolated trees
- Consider retrofitting irrigation to drip

Spray-to-Drip Retrofit

Spray-to-Drip Retrofit

Trees in Turf Replacement & Landscape Retrofits

- Meet tree water requirements during transition and beyond
- Irrigation distribution to match tree root zone
- Water requirement set by plant type with highest PF

Useful Equations

$$\text{Inches} = \text{Gallons} \div (\text{Sq. Ft.} \times 0.623)$$

$$\text{Gallons} = \text{Inches} \times \text{Sq. Ft.} \times 0.623$$

1 gal. can cover 1 sq. ft. with 1.6 in. of water

1 Billing Unit = 100 cubic ft. = 748 gallons

$$\text{Runtime Minutes} = \frac{\text{in. or gal. needed} \times 60}{\text{in. or gal. applied per hr.} \times \text{efficiency \%}}$$
