

# Intra-row weed control automation in California vegetable crops

Steve Fennimore, David Slaughter, HannahJoy Kennedy and John Rachuy  
University of California, Davis

# Introduction

- ❖ **Agricultural labor costs are rising**
- ❖ **Weed automation is needed in both agronomic and specialty crops**
- ❖ **Who will pay for the new technology?**
- ❖ **Barriers to adoption**

# Herbicide markets

**Corn 90.9 million acres**  
**Soy 89.5 million acres**  
**Wheat 45.7 million acres**  
**Cotton 12.1 million acres**

- ❖ Field corn production labor cost/A \$36
- ❖ Field corn weed control cost/A \$32
  - ❖ Iowa State University 2017

# VEGETABLES

**Lettuce 261,100 acres**

**Spinach 41,190 acres**

From the perspective of the Ag Chem industry these are *minor* crops because they require additional labelling for vegetables –which involves cost, time and risk. **These are obstacles!**

# ***Weed Management Practices & Costs 2015\****

<b>Practice</b>	<b>Romaine Hearts (\$/acre)</b>	<b>Organic Spinach (\$/acre)</b>
Herbicide application	51	0
Mechanical cultivation	46	39
Hand weeding	153	440
<b><i>Total weed mgt cost</i></b>	<b><i>250</i></b>	<b><i>479</i></b>

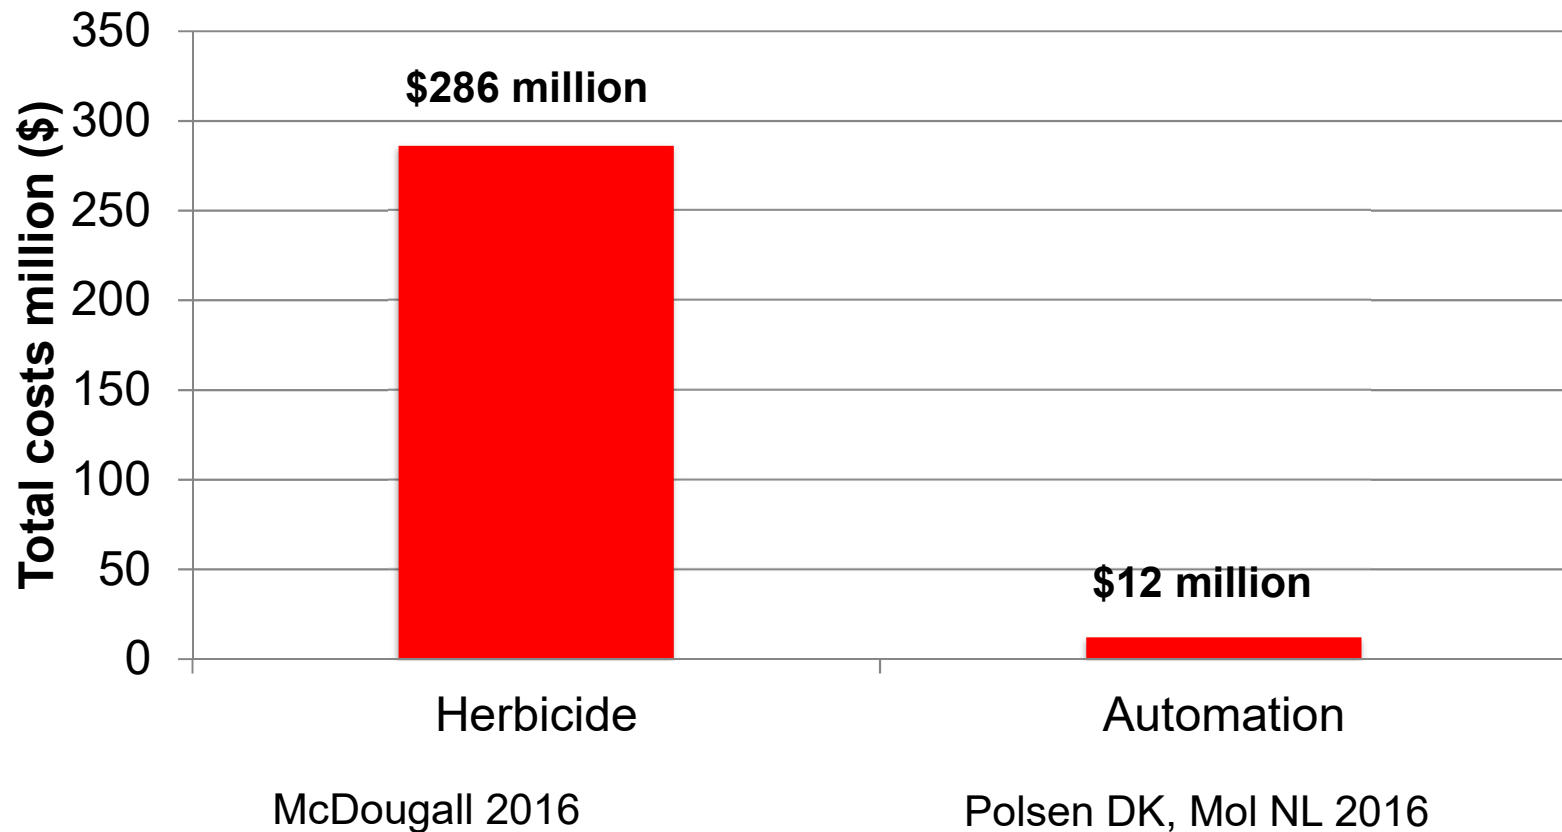

\* Source: UC Cooperative Extension Cost and Return Studies. <http://coststudies.ucdavis.edu>.  
Costs per acre include materials, equipment, and labor (\$16.10/hr. field; \$21.70/hr. machine).

# Commercial Intelligent cultivators

# Development costs: herbicides vs. automation

# Lower Barriers to Adoption

- ❖ Easier to move weeding devices between agronomic and specialty crops
  - ❖ Barriers are lower for devices than herbicides
- ❖ Standardization is needed if economies of scale are to be realized
  - ❖ Automated weeder technology adaptable for agronomic and specialty crops

# Inter- & intra-row cultivation

A traditional inter-row cultivator does not reach into the seedline

An intra-row cultivator weeds around and in the row

# The objective

- ❖ Develop a method for a machine to distinguish between a crop and weed

# Crop marking

- ❖ **The objective is to mark the crop so that a machine can “see” where the crop is and then the machine can remove weeds by spray or cultivation without harming the crop**

# Crop Signaling Concept

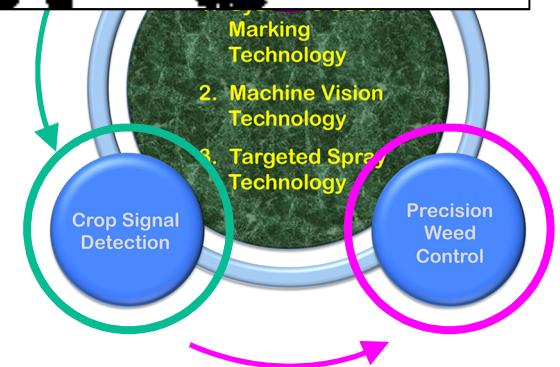

1. Machine Learning remains challenged by complex natural scenes.

2. That challenge can be overcome by taking a systems approach to automated weed control.

3. The principal point where crop identity is known with 100% certainty is at planting.

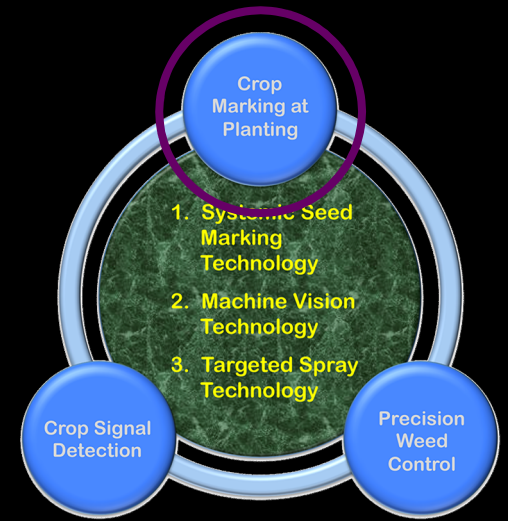

4. The systems approach transfers the knowledge of crop identity forward in time

5. For later use in automated weed management.

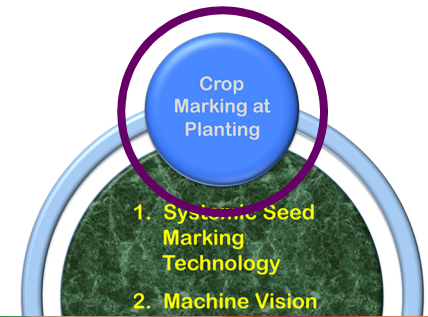

# Crop Signaling Concept

- Topical Markers

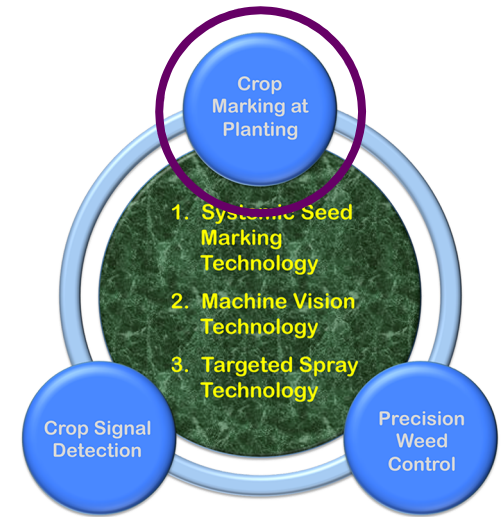

# Crop Signaling Prototype

- Topical Markers

# Crop Signaling Results

- Topical Markers

Signaling compound applied to tomato transplants at planting

# Crop Signaling Prototype

- Plant Labels

- Plants are tagged with a **biodegradable**, colored label at planting

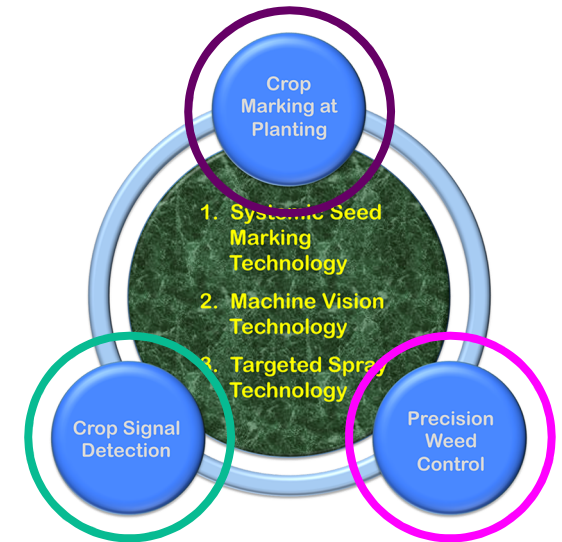

UC tomato plant labeling system

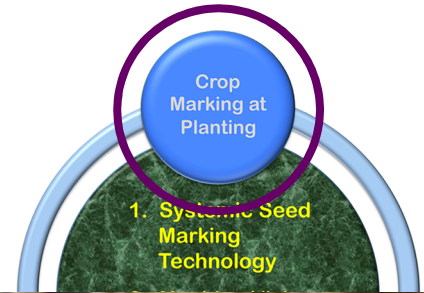

# Crop Signaling Results

- Plant Labels

# Crop Signaling Results

- Plant Labels

# Field trials 2017 - straws

- ❖ Processing tomato trial Davis, CA transplanted May 19, harvested Sept. 6, 2017, second trial transplanted July 2017.
- ❖ Romaine lettuce trial Salinas, CA seeded June 5, 15, & 27, 2017, harvested Aug. 18, 25, & Sept. 8, 2017
- ❖ Weed density counts before and after cultivation, hand weeding times measured

# Field trials 2017

- ❖ Trials were arranged in a RCB
- ❖ 4 to 8 reps
- ❖ No herbicide
- ❖ Treatments were automated cultivator, standard inter-row cultivator
- ❖ ACOVA, ANOVA using SAS GLM

# Weed densities and hand weeding times – lettuce 2017

	<b>Cultivator</b>	<b>No. ft<sup>2</sup> (LS Means)</b>	<b>% weed reduction</b>	<b>Time hr./A (LS Means)</b>	<b>% time reduction</b>

	<i>P-value</i>	<i>0.60</i>	<i>0.88</i>	<i>0.72</i>	<i>0.78</i>

Salinas, CA August-September 2017

# Weed densities and hand weeding times – tomato 2017

Cultivator	No. m2	% weed reduction	Time hr./A	% time reduction
Automated	14.2 B	82	46.3 B	39
Standard	78.1 A	0	76.0 A	0
P-value	<0.0001		0.0021	

Davis, CA May 2017

# Fresh weight yields per 100 m row – tomato 2017

Cultivator	Kg 100/m
Automated	186.6
Standard	212.9
P-value	0.30

Davis CA Sept. 2017

# Weed densities and hand weeding times – tomato 2017

Cultivator	No. m2	% weed reduction	Time hr./A	% time reduction
Automated	4.8 B	67	7.1 B	30
Standard	14.6 A	0	10.2 A	0
P-value	<0.0001		0.0007	

Davis, CA August 2017

# Summary

- ❖ The intra-row cultivator removed more weeds than the standard cultivator
- ❖ Hand weeding times were reduced by the intra-row cultivator compared to standard cultivator
- ❖ Crop yields were similar between both cultivator treatments

# **Band steam**

- ❖ Heating soil to 150-160°F for a few minutes kills soil pathogens and weed seed**
- ❖ Band Steaming has been evaluated in Denmark, Italy & Sweden with good weed control results**

# Field steam application setup

# Heat bars aligned with seed lines

# Disinfested seed lines

Disinfested  
bands scored  
by marker

# Seed lettuce into the disinfested band

# Methods

- ❖ **Innocul**
- ❖ **Innocul**
- ❖ **Grow to**

**special blend”**

# Methods continued

- ❖ Applied steam August 28 and 30, 2017
- ❖ Then transplanted lettuce August 31, 2017

# Steam evaluations in lettuce

Treatment	Temp min> 140°F	Weeds #ft <sup>2</sup>	% lettuce drop
Steam	13.5	2.6 b	1.5
Steam + Quick Lime	9.5	1.6 b	2.9
Control	0.0	37.2 a	8.1

# Steam photos

**No steam**

**Steam**

# Steam – summary

- ❖ **Is slow but we have new funding from USDA NIFA & will work to improve**
- ❖ **Weed control is >90%**
- ❖ **Lettuce drop evaluations will continue**

# **Funding Acknowledgements**

- ❖ Thanks to USDA NIFA Specialty Crop Research Initiative**
- ❖ California Leafy Greens Research Program**
- ❖ California Tomato Research Initiative**
