

How to Make a Succulent Terrarium

Materials

Arrangement of succulents
Glass container with wide opening
Gravel or pebbles
Cactus mix soil
Sand
Charcoal
Accents or garden ornaments: cement mushrooms; iron birds and snails; large river rocks;
and glass bugs and spiders

Steps

1. Pick out succulents that you would like to use in your terrarium.
2. Select a glass container. Remember to choose a container with a wide opening to prevent accumulation of moisture.
3. Place a 1/2-1 inch layer of gravel on the bottom of container; this provides drainage.
4. Add a layer of gardening charcoal.(Purchased at Fresno Ag)
5. Add a layer of sand.
6. Place a layer of cactus mix soil, a fast-draining soil that retains little moisture.
7. Remove plants from pots and place roots in soil.
8. Add accents or garden ornaments, such as cement mushrooms; iron birds and snails; large river rocks; and glass bugs and spiders.
9. Water every 2-3 weeks. Make sure the water is not pooling in the container.
